From Wikipedia, the free encyclopedia

DuckDB is an open-source column-oriented relational database management system (RDBMS) originally developed by Mark Raasveldt and Hannes Mühleisen at the Centrum Wiskunde & Informatica (CWI) in the Netherlands^[1] and first released in 2019.^[2] The project has over 6 million downloads per month. [3][4][5] It is designed to provide high performance on complex queries against large databases in embedded configuration, [1] such as combining tables with hundreds of columns and billions of rows. Unlike other embedded databases (for example, SQLite) DuckDB is not focusing on transactional (OLTP) applications and instead is specialized for online analytical processing (OLAP) workloads [6]

Core Extensions

List of Community Extensions

Community Extension

Community Extensions

Welcome to the documentation for the DuckDB Community Extension Repository. This website contains all documentation specific to community extensions. For documentation on DuckDB itself, check out the <u>DuckDB docs</u>.

What are Community Extensions

Community extensions are <u>DuckDB extensions</u> that are not maintained by the DuckDB team. This is different from the <u>Core extensions</u>, which *are* maintained by the DuckDB team. Community extensions are distributed through the <u>Community Extension Repository</u>, where anyone building an open-source DuckDB extension can make Pull Requests to submit an extension. Note that this makes DuckDB community extensions conceptually very similar to a package manager such as <u>Homebrew</u>.

How to Use a Community Extension

To install and load a community extension, simply run:

```
INSTALL <extension_name> FROM community;
LOAD <extension_name>;
```

community-extensions.duckdb.org

Community Extensions

Community Extension

h3

Hierarchical hexagonal indexing for geospatial data

Extension repository on GitHub 146

Extension descriptor ... 🦫

Installing and Loading

```
INSTALL h3 FROM community;
LOAD h3;
```

Example

```
SELECT h3_latlng_to_cell(37.7887987, -122.3931578, 9);
```

pg_duckdb

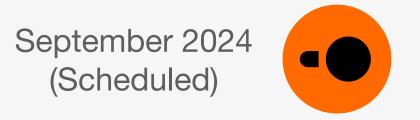

pg_duckdb: Official Postgres extension for DuckDB

pg_duckdb is a Postgres extension that embeds DuckDB's columnar-vectorized analytics engine and features into Postgres. We recommend using pg_duckdb to build high performance analytics and data-intensive applications.

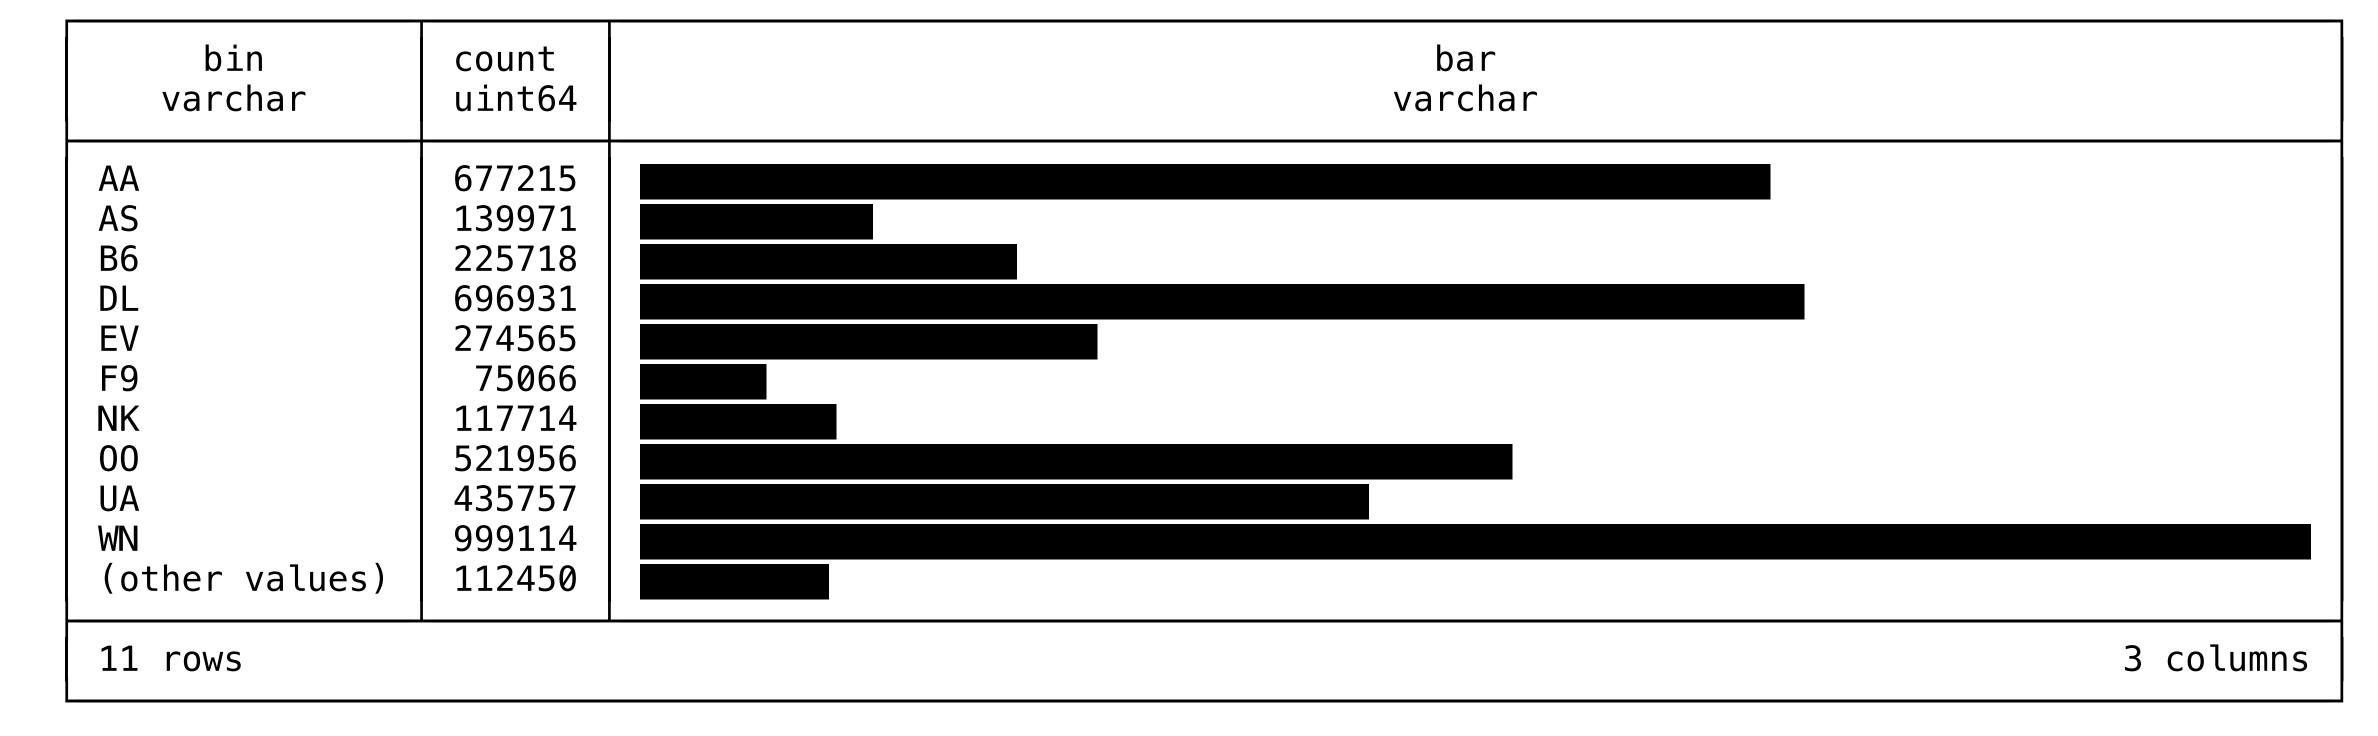

pg_duckdb was developed in collaboration with our partners, Hydra and MotherDuck.

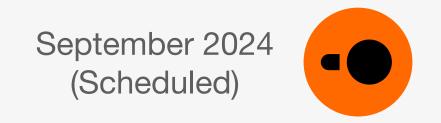

- histogram function allows you to quickly inspect the contents of a column
 - Bin boundaries determined automatically
 - Supported for all types

FROM histogram('~/Data/ontime.parquet/*.parquet', uniquecarrier);

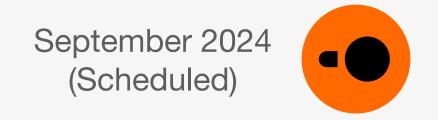

query and query_table functions

```
CREATE MACRO top_n_table(table_name) AS TABLE
SELECT MAX(COLUMNS(*), 3)
FROM query_table(table_name);
```

FROM top_n_values(nyctaxi);

vendor_id varchar[]	pickup_at timestamp[]	 tolls_amount float[]	improvement_surcha float[]	total_amount float[]
[2, 2, 2]	[2015-12-31 23:59:	 [1901.4, 1450.09,	[137.63, 2.39, 1.43]	[3950611.5, 826040
1 rows				19 columns (5 shown)

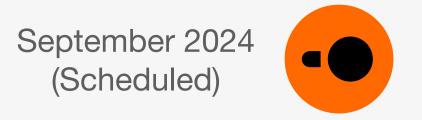

SQL-level variables

```
SET VARIABLE files_to_read=(SELECT LIST(files) FROM file_list);
```

SELECT * FROM read_csv(getvariable('files_to_read')) LIMIT 5;

l_orderkey int64	l_partkey int64	l_suppkey int64	l_linenumber int64	••	l_shipinstruct varchar	l_shipmode varchar	l_comment varchar

-							1C - 1 - 1 - 1 - 1 - 1 - 1 - 1

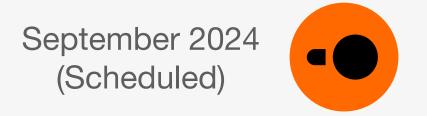

5 rows 16 columns (7 shown)

Unpacked COLUMNS

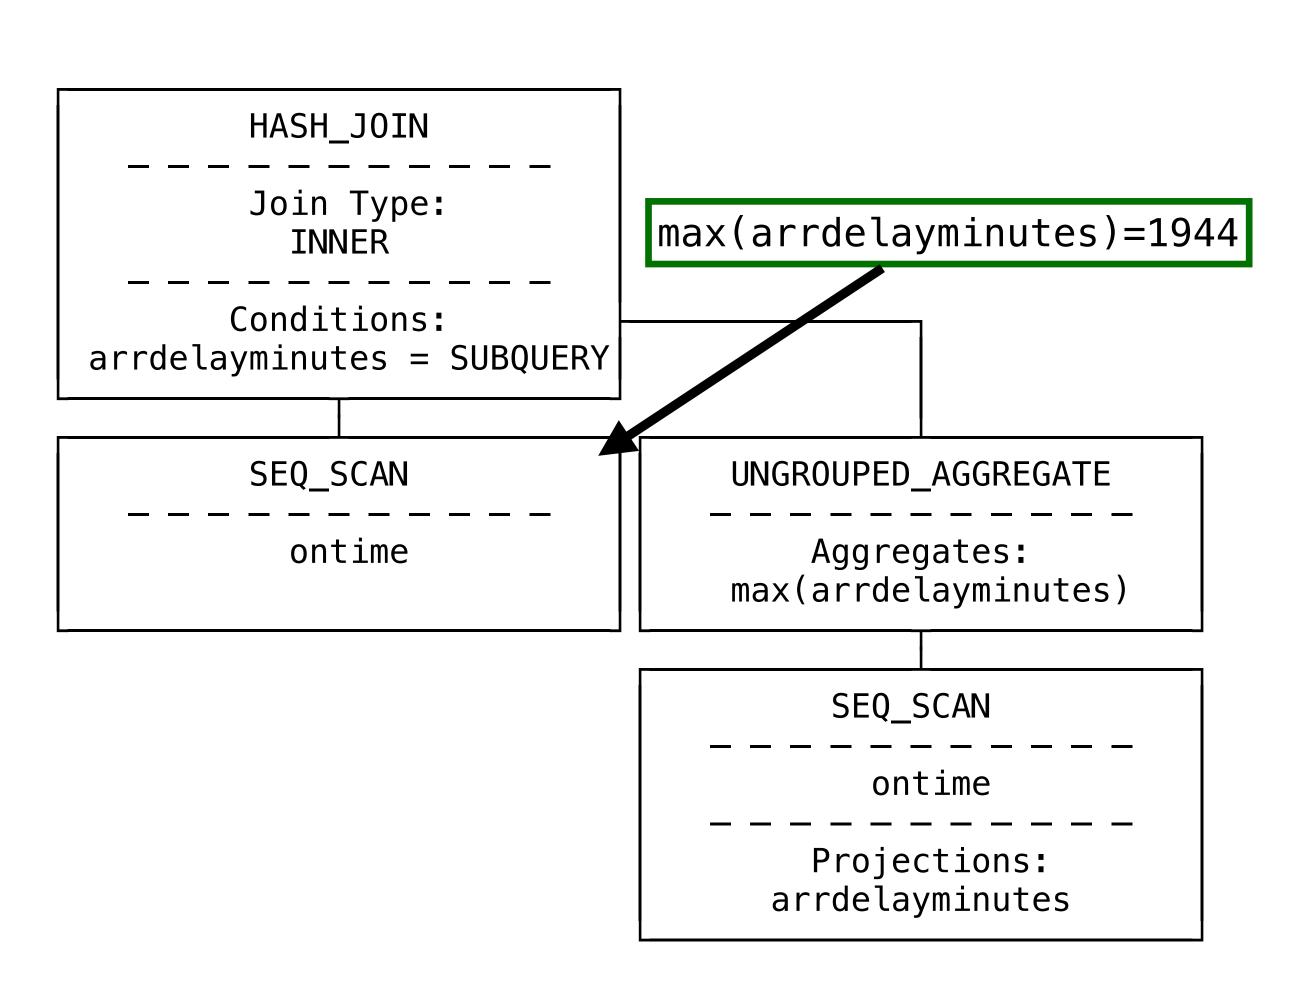

```
SELECT COLUMNS('arrdelay.*'), GREATEST(*COLUMNS('arrdelay.*')) AS greatest
FROM ontime
LIMIT 5;
```

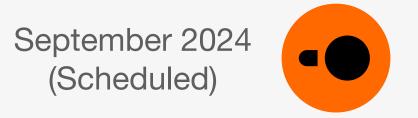

arrdelay	arrdelayminutes	greatest
double	double	double
-13.0 20.0 -14.0 -10.0 -43.0	0.0 20.0 0.0 0.0	0.0 20.0 0.0 0.0

Dynamically pushdown filters from joins

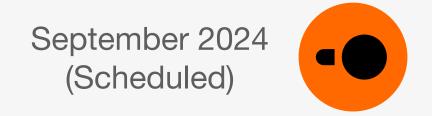

```
SELECT *
FROM ontime
WHERE arrdelayminutes=(
    SELECT max(arrdelayminutes)
    FROM ontime
);
```

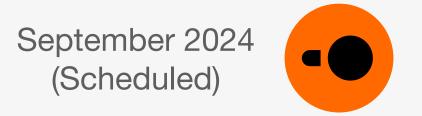

- Many CSV reader improvements
- Adaptive sniffing faster reading of many small CSV files
- Faster and less memory intensive union_by_name

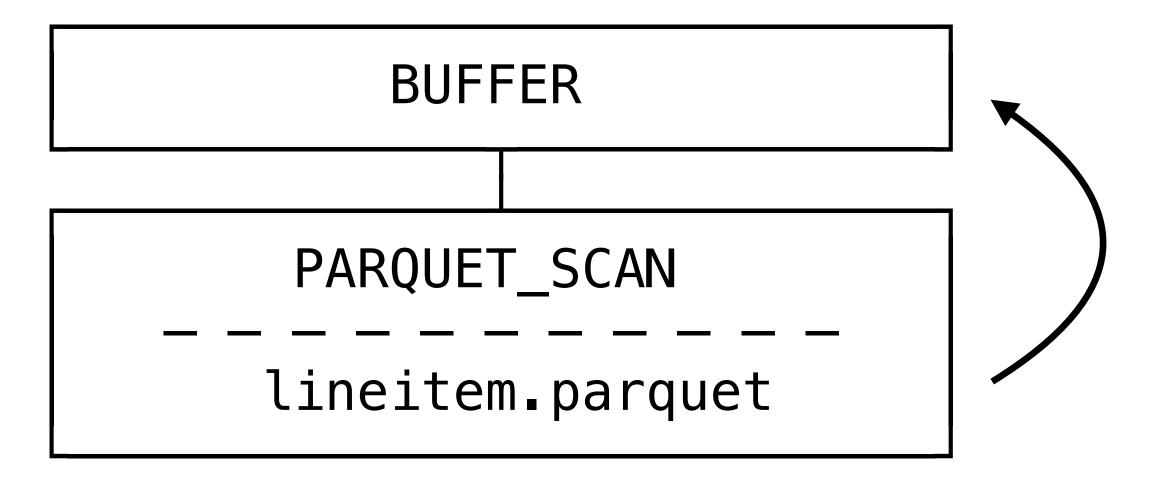

- Automatically re-use complex CTE results
 - Avoids repeated expensive computation

```
WITH revenue AS (
      SELECT
          l_suppkey AS supplier_no,
          sum(l extendedprice) AS total revenue
      FROM lineitem
      GROUP BY supplier_no
SELECT *
FROM supplier, <u>revenue</u>
WHERE
    s_suppkey = supplier_no
    AND total_revenue = (
      SELECT max(total_revenue)
      FROM revenue)
```

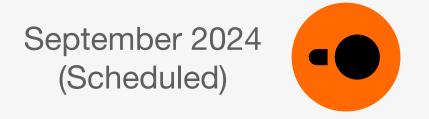

- Parallel streaming queries
 - Data is read into buffers in parallel until buffer is full
 - When buffer is consumed parallel streaming is resumed
- High performance without requiring entire result to fit in memory

```
SELECT *
FROM 's3:/duckdb-blobs/lineitem.parquet';
```
